### SELF PROPELLED BOOMS

# Booms boom on

This year, few manufacturers will launch new machines, following a bumper year of launches in 2000. Cranes & Access looks at why they will be consolidating and building sales of existing and recently launched models.

hat is the UK customer looking for this year when it comes to buying self-propelled booms? "Mid-range articulated diesel booms," is the immediate reply from Leigh Sparrow, vice president of UpRight International. "Bi-energy booms were very hot in the UK for a couple of years, but now the trend is towards diesel booms. And customers are also demanding rough terrain forward drive machines which come fitted with jibs." Sales of straight booms are, however, suffering because of the "diabolical rental rates", according to Sparrow.

But the good news for many manufacturers is that while the self-propelled boom sector is very much user led with the cost of hire often dictated by the cheapest machine for the contract, a growing number of rental companies and contractors are now beginning to realise that the technical advantages of a machine can affect the length of the hire.

Rod Lean, general sales manager for Europe at Snorkel, says: "An increasing number of forward looking rental companies are closely working with customers so that they can supply a machine with special features which make the access platform ideal for a specified contract and advantageous to the hirer." He adds that while sceptics could say that financially this is not good business for a rental company, if customers feel that the rental company has their interest at heart and helps them to reduce costs in one area, they are liable to use it for other hirings – bringing further business.

"Take for instance the simple task of working down the face of a building with a telescopic boom," he says. "When it is

lowered, the working basket describes an

arc making it necessary on most units to retract the boom, lower the boom and extend the boom which is a time consuming process. But Snorkel's technically advanced Envelope Management System with its "saw-toothing " effect eliminates these three individual boom functions in a stepless operation considerably reducing the overall time element and resulting in a smoother ride for the operator.

> Who's got the longest boom? Self propelled articulating booms

Manufacturer/Model	max. horizontal outreach	max. working height
1 JLG 150HAX	24.2 m	47.6 m
2 Grove Manlift AMZ131XT	21.3 m	39.9 m
3 Grove Manlift AMZ86XT	19.7 m	26.2 m
4 Time Condor A80	18.3 m	26 m
5 Skyjack SJB-66TK	18 m	22 m
6 Grove Manlift AMZ106XT	16.5 m	32.3 m
7 JLG 800A	16.1 m	26.2 m
8 Cela	16 m	28 m
9 Autoguns Rigo	16 m	23 m
10 Crane Manlift	15 m	26.5 m

#### **Trends**

As for sales, Steve Coulings, UpRight UK's national accounts director, believes the self-propelled boom industry has had a difficult time during 2000. "It wasn't the easiest of years. But we are confident about 2001. It is shaping up to be an optimistic year with a rocky first six months and then a steadying up in the second half. All the indications are there as a lot of independents are placing orders."

Despite this optimism, most manufacturers will focus on updating and revising their existing ranges rather than on launching a plethora of new self-propelled booms as they did last year. Sparrow explains: "We have spent a lot of money and time on developing our boom range in the past three years now the emphasis will be just on improving it. Our major investment this year will be in

growth in the self-propelled boom in the rest of Europe but not in the UK," Perrick Lourdain,

Pinguely-Haulotte's marketing manager. Instead the company will be promoting its Compact range the HA 16 PE and HA 12 DX self-propelled articulated booms it launched last year.

Snorkel, however, plans to launch several new technically advanced units but is reluctant

to give details. There are several projects on the drawing board, but which one will be unveiled at Bauma yet remains to be seen, according to Lean.

British manufacturer Niftylift is also an exception. It plans to launch a rough terrain version of its popular Height Rider Narrow (HR15N) that it launched at Hirex in 1998. John Keely, Niftylift's managing director, says: "Since the launch of the successful HR15N two years ago, customers have been expressing the need for a rough terrain machine but with the same innovative features and working envelope that the HR15N already offers. The HR15 is a natural extension of the existing product range and opens up a new segment of the access market for Niftvlift to develop."

Asked what's different about the HR15. Keely replies that it has 2 metre more outreach than competitor machines in its class, as well as a flyby and cage rotation at no extra weight or cost. And since it has been designed using 3D CAD technology, boom sections are stronger, lighter and safer than

At Bauma, visitors can once again see

the UpRight MB Mast Boom series that

was launched at Intermat last May. The

range includes the 8 metre working

height MB20N (narrow) with a 2.6

metre outreach and ultra slim 81cm wide

chassis. The larger MB26 has 10 metre

working height, 3 metre outreach and is

London has bought the latter for mainte-

nance work. A standard width (99cm) ver-

thing revolutionary to its self-propelled

boom range. Instead the company will be

marketing its first and only 60-foot elec-

tric self-propelled boom which was

launched last year. "It is coming to the

UK and we are confident that it will be

successful in this market," says ILG's

Terex's powered access business in

Europe, will also not be exhibiting any

new booms this year at Bauma. "There is

Pinguely-Haulotte, which takes over

marketing manager David Sumerling.

JLG will, likewise, not be adding any-

sion of the MB 20 is due out this Spring.

Brent Cross Shopping Centre in

0.99 cm wide.

Genie, which is about to move its UK headquarters from Newark to larger premises in Grantham, will be not adding new booms but will be instead revising its range, according to John Fuller, Genie's divisional director. At Hirex 2001, Genie will be exhibiting the

Runabaout series of small battery-powered self-propelled booms it launched last year. With a width of only 750mm, the GR8, GR12 and GR15 feature working heights of 2.54 metres, 3.58 metres and 4.62

Genie will be exhibiting Z-30/20N RJ with an optional hydraulic rotating jib at Hirex 2001

metres respectively. All three utilise the same vertically extending mast system as used on Genie's AWP Super Series platforms. The three units also have an optional 113kg capacity platform

Genie will be aggressively marketing its Z30/20N RJ articulating boom this year. This features an optional rotating jib and provides 200 degrees of horizontal rotation and a 144-degree working range.

#### **Alliances**

A strategic alliance between Grove and Skyjack which was announced last year has resulted in Skyjack dropping its boom range with the exception of the small SJLJB-12T electric powered boom which was launched at Apex 2000. Since the show the company says orders approaching 100 units have already been secured. As a result of the new alliance the Skviack subsidiary company was renamed Skviack UK and took over from Russon as its new UK dealer. The new company will also market the Grove Manlift range in the UK. The downsizing of this range as announced at the end of last year by Grove chief executive officer Jeff Bust will mean future emphasis is likely to centre on the production of larger models such as the latest A60I, T80 and T86I.

Meanwhile, Manitou's sales and marketing agreement with Aichi that was announced at Apex means that Manitou Site Lift will be aiming to make inroads into the British self-propelled market. Nick Egan, Manitou's Powered Access Product manager, says "the first Manitou tracked booms will arrive in the UK in February followed shortly be wheeled telescopic booms".
